

NTK Eigenvalue Spectra by Architecture — at initialization
Two-phase structure: bulk decay ($k < \text{cliff}$) $\rightarrow$ spectral cliff $\rightarrow$ near-zero tail ($k > \text{cliff}$)

Spectral cliff at $k \approx 102$
Eigenvectors beyond this index
have $\lambda < 10^{-4}$ — near-zero gradient
flow for high-frequency components.
Explains PINN spectral bias at $\beta=50$.
